Archiving by Design Card deck - Standardized User Stories

Instruction

This card deck holds 20 standardized user profiles that can be used by the AbD team in preparation for an AbD study. Twelve of these constitute actual users of the information in the system being studied, while eight are specialist profiles that are involved in designing a system environment but do not use the information themselves.

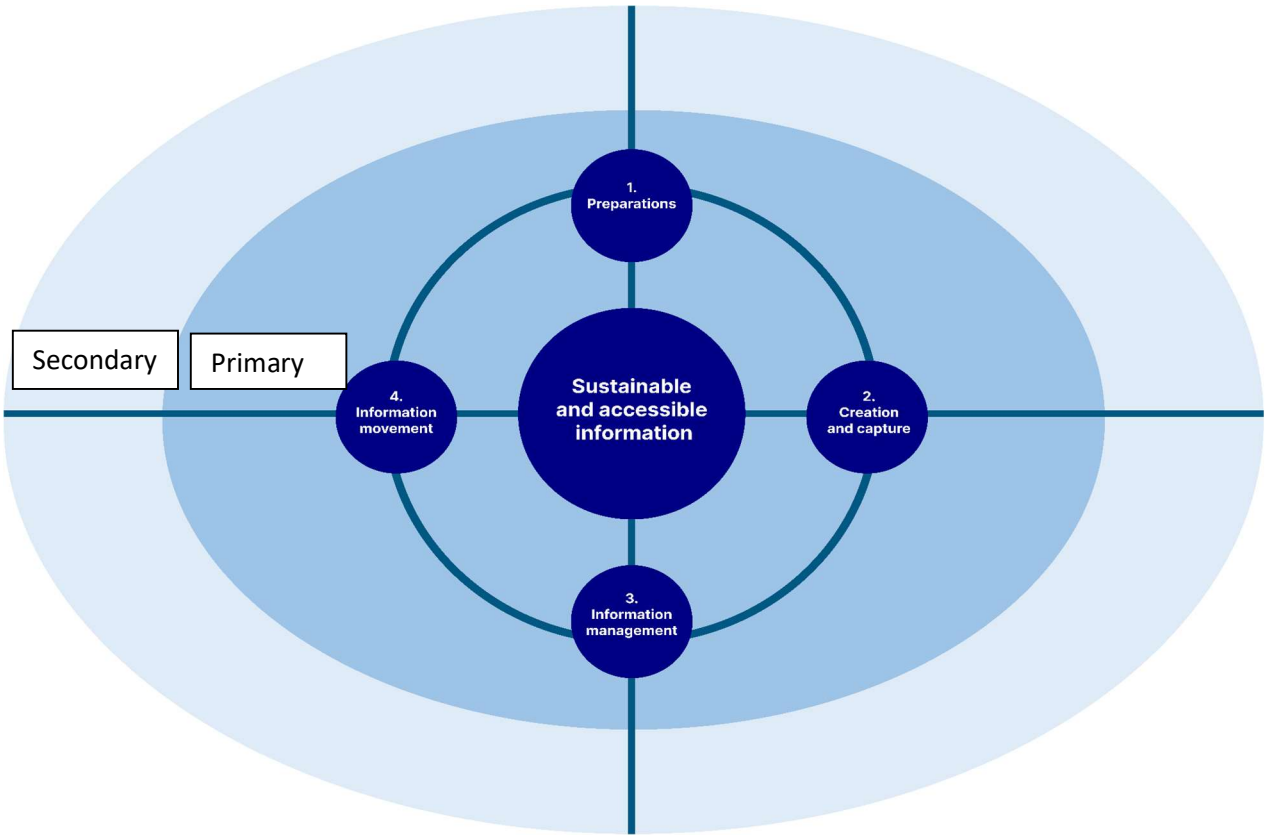

The following twelve user profiles are:
1. The Citizen
2. The Case Handler
3. The Case Party
4. The Controller
5. The Manager
6. The Politician
7. The System Administrator
8. The Entrepreneur
9. The Re-user
10. The Journalist
11. The Researcher
12. Joker – a specific user

The eight specialists are:
- The System Provider (the one who sells)
- The Information Security Specialist (alignment with regulations)
- The IT Architect (information structure)
- The Archivist (preservation and disposal)
- The Data Strategist (open data)
- The Sponsor (resources and timelines)
- The Procurer (using AbD requirements in procurement)
- The Data Protection Specialist (personal data)

Profiles 1–12 can appear both as primary and secondary users, and can therefore advantageously be printed in multiple copies, as their needs may arise several times during the information lifecycle. The specialists can, of course, depending on which system is the subject of the AbD study, also be case officers or hold another role (for example, an archivist for an e-archive system, or a purchaser for a procurement system).
Feel free to print out the template with the lifecycle on an A3 sheet to make it easier to visualize at what stage and in what way a user's needs are expressed. The lifecycle presented reflects the AbD study's view of archiving as a process that starts early in the life of information, even before the document has been created.

The phases are:
1. Planning and setting up an information environment and management processes,
2. Information is created or captured,
3. Information is managed, protected, and maintained, and
4. Information moves to new storage locations or is destroyed.

Keep in mind that standardized user stories should not be used as a substitute for investigating the actual users' needs in relation to a specific system. The standard profiles are to be used to prevent important perspectives from being overlooked in the planning of an AbD study. However, some profiles can, especially in the role of secondary users, fully function as general representatives of needs.

Profile cards och lifecycle play mat is available for print out

Please print out the play mat on A3 and the profile cards single side copy. Cut out and fold the cards for easy use.
